

CONTRIBUTING.md

Contributing to Pizdit?

Thank you for your interest in contributing to **Pizdit?**

Pizdit? is an open-source civic-tech project for evidence-based political claim analysis.

This project deals with elections, politicians, public claims, and sensitive civic information. Contributions must be careful, transparent, and source-backed.

Project values

We care about:

- evidence over opinion;
 - transparency;
 - auditability;
 - political neutrality in the analytical layer;
 - legal safety;
 - privacy;
 - global accessibility;
 - simple public UX;
 - rigorous internal methodology.
-

What you can contribute

You can help with:

- frontend development;
- backend development;
- Supabase schema improvements;
- country adapters;
- election data sources;
- candidate source mapping;
- translations;
- UI/UX improvements;
- documentation;
- methodology review;
- prompt improvements;
- source quality rules;
- test cases;
- evaluation fixtures;
- accessibility improvements;
- privacy review;

- legal risk review.
-

What requires extra review

The following changes require stricter review:

- changes to claim rating rules;
 - changes to candidate verdict formula;
 - changes to source quality rules;
 - changes to AI prompts;
 - changes to audit logic;
 - changes to human review rules;
 - new country adapters;
 - politically sensitive wording;
 - candidate or party analysis;
 - source reliability changes;
 - legal or safety policy changes.
-

Contribution rules

1. Be source-backed

Any political, factual, or methodological change should include sources.

Good sources include:

- election commissions;
- government records;
- official statistics;
- legislative voting records;
- court records;
- official candidate or party websites;
- reputable media;
- independent fact-checkers;
- academic or NGO research.

Avoid relying on:

- anonymous blogs;
 - unsourced screenshots;
 - partisan claims without evidence;
 - edited clips without context;
 - anonymous social media posts;
 - campaign attack ads without documentation.
-

2. Do not submit unsupported accusations

Do not submit claims like:

Candidate X is corrupt.

Instead, submit structured, source-backed information:

Source Y reports an unresolved allegation related to Topic Z. No final legal finding is available in the sources provided.

3. Prefer claim-level analysis

The system should evaluate specific claims, not personalities.

Good:

The claim "We reduced unemployment by 40%" is not supported by official labor statistics.

Bad:

This politician always lies.

4. Keep public wording careful

The product name can be provocative.

The analytical layer must be precise.

Prefer:

- "unsupported claim"
- "misleading statistics"
- "insufficient evidence"
- "outside legal authority"
- "contradicts voting record"
- "no implementation plan"

Avoid:

- "liar"
- "criminal"

- “corrupt”
 - “traitor”
 - “enemy”
 - “evil”
-

5. Protect privacy

Do not commit:

- raw user addresses;
 - user search logs;
 - private voter data;
 - API keys;
 - tokens;
 - admin credentials;
 - private moderation notes;
 - unpublished allegations;
 - personal data that is not clearly public-interest information.
-

Country adapter contributions

Country adapters are one of the most important parts of the project.

A country adapter should document:

- official election authority;
- election data source URLs;
- district boundary sources;
- candidate registration sources;
- ballot structure;
- supported election levels;
- supported languages;
- known limitations;
- legal risks;
- source reliability notes.

Each adapter should implement, where possible:

```
interface CountryAdapter {
    countryCode: string;

    getUpcomingElections(input: {
        regionName?: string;
        municipalityName?: string;
        districtName?: string;
    }): Promise<Election[]>;

    getDistrictForAddress(input: {
```

```

    address?: string;
    latitude?: number;
    longitude?: number;
  }): Promise<ElectoralDistrict | null>;

getCandidatesForElection(electionId: string): Promise<Candidate[]>;

getOfficialSourcesForCandidate(candidateId: string):
Promise<CandidateSource[]>;

getOfficialSourcesForParty?(partyId: string): Promise<CandidateSource[]>;

normalizeAddress?(address: string): Promise<string>;

getPollingPlaceUrl?(input: {
  address?: string;
  districtId?: string;
}): Promise<string | null>;
}

```

Prompt contributions

Prompt changes must include:

1. Reason for change
2. Before/after prompt text
3. Expected behavior change
4. Test cases
5. Known risks

Do not change prompts casually.

Prompts affect published political analysis and must be treated as part of the methodology.

Methodology contributions

Methodology changes must be clear and reviewable.

Examples:

- changing the threshold for “Insufficient data”;
- changing source reliability levels;
- changing how candidate verdicts are aggregated;
- changing when human review is required;
- adding new claim tags;
- changing rating definitions.

Every methodology change should include:

- explanation;
 - examples;
 - edge cases;
 - migration impact, if any.
-

Pull request checklist

Before opening a pull request, check:

- ☐ The change is clearly described.
 - ☐ Political claims are source-backed.
 - ☐ No private data is included.
 - ☐ No API keys or secrets are included.
 - ☐ Public wording is legally careful.
 - ☐ Tests or fixtures are updated where relevant.
 - ☐ Methodology changes are documented.
 - ☐ Prompt changes include examples.
 - ☐ Country adapter changes include source documentation.
 - ☐ The change does not add live AI calls to voter-facing flows.
-

Core architectural rule

Do not add live AI analysis to the public voter-facing flow.

Correct:

```
Batch/admin pipeline → audited database result → public app reads result.
```

Incorrect:

```
Public user opens candidate page → app calls AI model live → result shown directly.
```

Local development

Recommended setup:

```
pnpm install  
pnpm dev
```

Recommended environment variables:

```
NEXT_PUBLIC_SUPABASE_URL=  
NEXT_PUBLIC_SUPABASE_ANON_KEY=  
SUPABASE_SERVICE_ROLE_KEY=  
AI_PROVIDER=  
AI_API_KEY=  
GEOCODING_PROVIDER=  
GEOCODING_API_KEY=
```

Never commit `.env` files.

Issue labels

Suggested labels:

```
frontend  
backend  
database  
ai-pipeline  
country-adapter  
methodology  
prompts  
privacy  
legal-risk  
documentation  
good-first-issue  
needs-sources  
needs-review  
high-risk
```

Code of conduct

Be direct, careful, and respectful.

This project may involve politically sensitive topics. Debate methods and evidence, not people.

No harassment, threats, hate speech, or targeted abuse.

Disclaimer

Contributing to Pizdit? does not make any contributor responsible for official election information.

Official election dates, registration requirements, polling places, and ballot information should always be verified through official election authorities.
