

README.md

Pizdit?

Pizdit? is an open-source civic-tech project that helps voters understand what politicians are saying before election day.

The product shows upcoming elections based on a user's address, lists candidates or parties on the ballot, and provides evidence-based analysis of political claims, promises, and public statements.

The goal is not to tell people who to vote for.

The goal is to show:

- what candidates claim;
- which claims are supported by evidence;
- which claims are misleading, unsupported, false, or unverifiable;
- what sources were used;
- how the analysis was produced;
- whether the result passed independent AI audit and human review when needed.

Product principle

Address → Election → Candidates → Verdict → Evidence

The public experience should be extremely simple.

The underlying methodology should be transparent, auditable, and open.

Why this exists

Most voters do not have time to read long political programs, track candidate statements, compare budget promises, check legal authority, or verify statistics.

Campaigns often use:

- vague promises;
- selective statistics;
- emotional manipulation;
- fear-based rhetoric;
- promises without budgets;
- promises outside the candidate's legal authority;
- claims that contradict previous voting records.

Pizdit? helps voters see the evidence behind political claims without forcing them to become full-time political researchers.

What Pizdit? does

Pizdit? helps users:

1. Enter an address or select a region manually.
 2. See upcoming elections in their area.
 3. See candidates or parties on their ballot.
 4. Open candidate cards.
 5. Read short verdict summaries.
 6. Inspect checked claims.
 7. Open sources and evidence.
 8. See audit status and confidence level.
-

What Pizdit? does not do

Pizdit? does **not**:

- tell users who to vote for;
 - provide direct voting recommendations;
 - host public comments;
 - host political debates;
 - collect voter profiles;
 - require public user accounts;
 - run live AI analysis when a voter opens a candidate page;
 - publish unaudited AI outputs;
 - allow anonymous accusations against candidates.
-

Core rule

No live AI calls in the voter-facing flow.

Public users only see already processed, audited, cached data.

AI runs in an admin/batch pipeline before publication.

Fact-checking architecture

Every claim check goes through a three-stage pipeline:

```
Political claim
  ↓
Research Agent A
  ↓
Research Agent B
  ↓
Audit Agent
  ↓
Publish / Human review / Reject
```

Research Agent A

Independently verifies the claim using reliable sources.

Research Agent B

Verifies the same claim independently, ideally from a different research path.

Audit Agent

Compares both research outputs, checks source quality, detects disagreement, and decides whether the claim check can be published.

The Audit Agent is stricter than both research agents.

Claim ratings

Claim-level ratings:

```
type ClaimRating =
  | "TRUE"
  | "MOSTLY_TRUE"
  | "MIXED"
  | "MISLEADING"
  | "UNSUPPORTED"
  | "FALSE"
  | "UNVERIFIABLE";
```

Candidate-level verdicts:

```
type PizditVerdict =
  | "YES_OFTEN"
  | "LIKELY_YES"
  | "MIXED"
```

```
| "LIKELY_NO"  
| "INSUFFICIENT_DATA";
```

Candidate-level verdicts must be computed from audited claim-level checks, not generated directly by a single AI model.

Source quality

Preferred sources:

1. Election commission data
2. Government records
3. Parliamentary, municipal, or legislative voting records
4. Official candidate programs
5. Official party programs
6. Public statistics databases
7. Court records
8. Reputable media
9. Independent fact-checking organizations
10. Academic or NGO reports
11. Verified social media accounts of candidates or parties

Weak sources should not be used as primary evidence unless clearly marked.

Open-source trust model

Pizdit? is open-source because political analysis systems must be inspectable.

The public repository should include:

- application code;
- database schema;
- type definitions;
- country adapter interfaces;
- prompts;
- methodology;
- source quality rules;
- claim rating rules;
- audit rules;
- candidate verdict formula;
- evaluation fixtures;
- test claims;
- documentation.

Open-source does not mean exposing private production data, API keys, unpublished allegations, admin notes, or user information.

Suggested repository structure

```
/
  apps/
    web/
    admin/
  packages/
    core/
    db/
    ai/
    adapters/
    ui/
  country-adapters/
    generic/
    pt/
    us/
    ge/
    uk/
  methodology/
    source-quality-rules.md
    claim-rating-rules.md
    audit-rules.md
    candidate-verdict-formula.md
    human-review-rules.md
  prompts/
    claim-extraction.md
    research-agent-a.md
    research-agent-b.md
    audit-agent.md
  evaluation/
    test-claims.json
    expected-ratings.json
    source-fixtures.json
  docs/
    architecture.md
    contributing.md
    adapter-guide.md
    methodology.md
    privacy.md
```

Recommended stack

- Next.js
- React
- TypeScript
- Tailwind CSS
- shadcn/ui
- Supabase

- PostgreSQL
- Supabase Storage
- Vercel
- Background job queue
- AI provider abstraction layer
- Optional vector search for source chunks

AI provider abstraction

The system should not depend on one hardcoded AI provider.

```
interface AIProvider {  
  runResearchAgent(input: ResearchAgentInput): Promise<ResearchAgentResult>;  
  runAuditAgent(input: AuditAgentInput): Promise<AuditAgentResult>;  
  extractClaims(input: ClaimExtractionInput): Promise<PoliticalClaim[]>;  
}
```

Country adapters

Pizdit? is global-first.

Each country should have a dedicated adapter for:

- election lookup;
- district matching;
- candidate discovery;
- official source discovery;
- polling place links, if available;
- country-specific source rules.

```
interface CountryAdapter {  
  countryCode: string;  
  
  getUpcomingElections(input: {  
    regionName?: string;  
    municipalityName?: string;  
    districtName?: string;  
  }): Promise<Election[]>;  
  
  getDistrictForAddress(input: {  
    address?: string;  
    latitude?: number;  
    longitude?: number;  
  }): Promise<ElectoralDistrict | null>;  
  
  getCandidatesForElection(electionId: string): Promise<Candidate[]>;  
}
```

```
getOfficialSourcesForCandidate(candidateId: string):  
Promise<CandidateSource[]>;  
  
getOfficialSourcesForParty?(partyId: string): Promise<CandidateSource[]>;  
  
normalizeAddress?(address: string): Promise<string>;  
  
getPollingPlaceUrl?(input: {  
  address?: string;  
  districtId?: string;  
}): Promise<string | null>;  
}
```

Privacy principles

Pizdit? should collect as little user data as possible.

Rules:

- No public user accounts.
- Use address only to find election district.
- Provide manual region selection as fallback.
- Do not store public user search history in MVP.
- Do not sell or share location data.
- Cache geocoding results using normalized hashes where possible.

Suggested privacy copy:

We use your address only to find your election district. No account needed.

Legal and safety principles

The product must avoid unsupported personal accusations.

Do not write:

This candidate is lying.

Prefer:

This specific claim is not supported by the available evidence.

Do not write:

This candidate is corrupt.

Prefer:

Public reporting from named sources describes allegations related to this topic. The available evidence does not establish a final legal finding.

The brand can be provocative. The analysis must be careful.

Development status

Early concept / pre-MVP.

Recommended first build phases:

1. Static global prototype
 2. Core database schema
 3. Country adapter layer
 4. Address and district matching
 5. Admin panel
 6. Source ingestion
 7. AI claim-checking pipeline
 8. Human review queue
 9. Public MVP
-

License

License is not selected yet.

Recommended options:

- MIT for maximum adoption;
 - Apache 2.0 for stronger patent protection;
 - AGPLv3 if hosted derivatives should also remain open-source.
-

Disclaimer

Pizdit? is a civic information tool.

It does not provide legal advice, voting instructions, or official election information.

Users should always verify official election dates, polling locations, registration requirements, and ballot information through official election authorities.
